

POST-OPERATIVE INSTRUCTIONS SHOULDER REPLACEMENT

At your preoperative consent visit, medications for after surgery will be sent to your pharmacy. These include:

Ketorolac (anti-inflammatory)

*do not take if you have a history of stomach ulcers or kidney disease.

Gabapentin (pain medicine, helps sleep at night)

Oxycodone (pain medicine)

Tylenol (anti-inflammatory)

Pantoprazole (protects stomach from ulcers, with anti-inflammatory use)

Clindamycin (prophylactic antibiotic)

Medrol (anti-inflammatory)

*do not take medrol if you are diabetic

Please pick these medications up prior to surgery so you will have them at home after your surgery.

Please review this list, and make the doctor and/or staff aware of any allergies or issues you have with these medications.

Unlike other joint replacements (hip and knee), blood thinners (such as aspirin) are not required after a shoulder replacement.

If you already take a blood thinner, restart your normal blood thinner as prescribed the day after surgery. Normally, this will be discussed with your primary care physician and/or cardiologist prior to surgery.

NERVE BLOCK

You will get a nerve block the morning of surgery. This provides pain relief for after surgery.

These normally last 24-48 hours. **However, do not wait for your nerve block to wear off.**

Begin taking medicines as prescribed once you get home so you will not fall behind and have issues with pain control.

PHYSICAL THERAPY

Physical therapy is a very important part of the recovery process. Therapy needs to be set up prior to your surgery and starts the week of your surgery. Most of the time, home health is set up prior to surgery and includes a therapist coming to your house for the first 1-2 weeks. After this, you will begin outpatient therapy.

You can find my physical therapy rehabilitation protocol on my website:

<https://www.toolesportsmedicine.com/pdfs/total-shoulder-arthoplasty-rehab.pdf>

After surgery, you will have a sling with a pillow (called a shoulder abduction sling). This helps protect your shoulder replacement and decrease pain. This will be worn off and on for the first 4-6 weeks.

At the time of surgery, you will have an ice machine placed on your shoulder under the surgical dressing. This is known as cryotherapy. This helps greatly after surgery with swelling, inflammation, and pain.

You will have a follow up appointment scheduled for one week after your shoulder replacement.

Please contact office directly, with any questions or concerns.
